**Instructions to Students**

- Identify arithmetic errors and performance bottlenecks in the given problem.
- Analyse the execution steps to locate the source of errors.
- Debug the algorithm by correcting logical and computational faults.
- Optimize the solution using appropriate arithmetic techniques or algorithms.
- Evaluate the optimized solution for correctness, accuracy, and efficiency.

**QUESTIONS**

1. A computer system performing signed binary subtraction using 2's complement produces incorrect results for certain operand combinations. Debug the subtraction process by examining binary conversion, complement generation, and overflow detection. Suggest appropriate corrections to ensure accurate signed arithmetic.
2. A digital processor implementing a carry look-ahead adder fails to produce the correct sum for some input combinations. Debug the generate and propagate logic to identify the source of the error. Recommend modifications that restore correct operation while maintaining high-speed performance.
3. A hardware multiplier using Booth's algorithm consumes more clock cycles than expected during signed multiplication. Debug the execution sequence by analyzing bit-pair decisions, arithmetic shifts, and register updates. Propose optimization techniques to improve execution efficiency without affecting accuracy.
4. A processor implementing the non-restoring division algorithm produces incorrect quotient values for specific dividend and divisor combinations. Debug the step-by-step division process by examining partial remainders, shifting operations, and quotient-bit generation. Suggest corrections to obtain accurate division results.
5. A graphics processing application experiences performance degradation due to frequent floating point computations using IEEE 754 double-precision representation. Debug the arithmetic operations to identify unnecessary precision or computational overhead. Recommend suitable optimization techniques to improve execution speed while maintaining the required numerical accuracy.

**Code of Conduct**

*I LOKESH S (192572151) (Name / Reg No) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic*

*integrity rules will result in disciplinary action.*

**Signature of the Student: LOKESH S**

**RUBRICS FOR CALCULATION**

| Criteria                         | Weightage (%) | Level 4 – Exemplary (5 Marks)                                                           | Level 3 – Proficient (4 Marks)                                | Level 2 – Developing (2–3 Marks)                      | Level 1 – Beginning (0–1 Mark)                          |
|----------------------------------|---------------|-----------------------------------------------------------------------------------------|---------------------------------------------------------------|-------------------------------------------------------|---------------------------------------------------------|
| Identification of Errors / Bugs  | 20            | Accurately identifies all errors and issues with complete understanding of the problem  | Identifies most errors with minor omissions                   | Identifies limited errors; misses key issues          | Unable to identify errors or misunderstands the problem |
| Debugging Approach & Analysis    | 20            | Uses effective debugging techniques with clear analysis and root cause identification   | Applies suitable debugging methods with minor gaps            | Uses basic debugging methods with limited analysis    | No systematic debugging approach followed               |
| Correctness of Debugged Solution | 25            | Provides completely corrected solution with accurate functionality and expected output  | Provides working solution with minor errors                   | Partially correct solution with limited functionality | Incorrect solution or fails to resolve errors           |
| Optimization Techniques Applied  | 20            | Applies efficient optimization methods to improve performance, memory usage and quality | Performs optimization with noticeable improvements            | Limited optimization with minimal improvements        | No optimization applied or inefficient implementation   |
| Testing and Documentation        | 15            | Performs complete testing with proper validation and clear documentation                | Provides adequate testing and documentation with minor issues | Limited testing and incomplete documentation          | No proper testing or documentation provided             |

## **1. SIGNED BINARY SUBTRACTION USING 2'S COMPLEMENT**

Problem

A computer system performing signed binary subtraction using 2's complement produces incorrect results for certain operand combinations

due to errors in binary conversion, complement generation, or overflow detection.

### **Debugging Steps**

1. Verify that both operands are converted correctly into binary.
2. Ensure both numbers use the same number of bits (sign extension if necessary).
3. Generate the 2's complement of the subtrahend correctly (invert bits and add 1).
4. Perform binary addition instead of subtraction.
5. Ignore the final carry-out.
6. Check the sign of the result.
7. Detect overflow.

### **Solving Steps**

Example:  $7 - 3$

$7 = 0111$

$3 = 0011$

2's complement of 3

0011

1100

+0001

-----

1101

Addition

0111

+ 1101

-----  
1 0100

Result = 0100 = 4

### **Detect Overflow**

**Overflow occurs when:**

- Two positive numbers produce a negative result.
- Two negative numbers produce a positive result.

### **Overflow Condition:**

Carry into MSB  $\neq$  Carry out of MSB

Example:

0111  
+0011

-----

1010

Overflow = Yes

### **Result**

Correct signed subtraction is achieved by proper binary conversion, correct 2's complement generation, and overflow detection.

## **2. CARRY LOOK-AHEAD ADDER (CLA)**

### **Problem**

A Carry Look-Ahead Adder fails to produce the correct sum because of errors

in Generate (G) and Propagate (P) logic.

### **Debugging Steps**

1. Verify Generate logic.
2. Verify Propagate logic.
3. Check carry equations.
4. Test XOR outputs.
5. Verify wiring connections.
6. Test all input combinations.

### **Solving Steps**

Given:

$$A = 1010$$

$$B = 0101$$

$$C_{in} = 0$$

Generate:

$$G_i = A_i \times B_i$$

Propagate:

$$P_i = A_i \oplus B_i$$

Carry:

$$C_1 = G_0 + P_0 C_{in}$$

$$C_2 = G_1 + P_1 G_0 + P_1 P_0 C_{in}$$

$$C_3 = G_2 + P_2 G_1 + P_2 P_1 G_0 + P_2 P_1 P_0 C_{in}$$

Sum:

$$S_i = P_i \oplus C_i$$

### **Detect Overflow**

**Overflow occurs if:**

Carry into MSB  $\neq$  Carry out of MSB

- Positive + Positive = Negative
- Negative + Negative = Positive

### **Result**

Correct Generate and Propagate logic restores accurate and high-speed addition.

## **3. BOOTH'S MULTIPLICATION ALGORITHM**

### **Problem**

A Booth multiplier consumes more clock cycles than expected during signed

multiplication.

### **Debugging Steps**

1. Verify Booth bit pair ( $Q_{-1}, Q_0$ ).
2. Check Add/Subtract operation.
3. Verify arithmetic right shift.
4. Verify accumulator update.
5. Verify multiplier register.
6. Verify counter decrement.
7. Repeat until counter becomes zero.

### **Solving Steps**

Example:

Multiplicand = 5 = 0101

Multiplier = 3 = 0011

### **Booth Rules**

| $Q_{-1}$ | $Q_0$ | Operation    |
|----------|-------|--------------|
| 00       |       | No Operation |
| 01       |       | Add M        |
| 10       |       | Subtract M   |
| 11       |       | No Operation |

Each cycle:

- Check bit pair.
- Perform operation.
- Arithmetic right shift.
- Update registers.
- Decrement counter.

Final Product:

00001111 = 15

### **Detect Overflow**

**Overflow occurs when:**

- Product requires more bits than available.
  - Sign extension becomes incorrect.
- Check whether the product exceeds the register size.

### **Result**

Correct Booth decisions, arithmetic shifts, and register updates reduce execution cycles while maintaining accurate signed multiplication.

## **4. NON-RESTORING DIVISION ALGORITHM**

### **Problem**

A processor implementing the non-restoring division algorithm produces

incorrect quotient values.

### **Debugging Steps**

1. Verify dividend and divisor loading.
2. Check left shift operation.
3. Verify subtraction/addition.
4. Check partial remainder.
5. Generate quotient bit correctly.
6. Restore remainder if necessary.
7. Verify final quotient and remainder.

### **Solving Steps**

Example:

Dividend = 13 (1101)

Divisor = 3 (0011)

Steps:

1. Shift left.
2. Subtract divisor.
3. If remainder  $\geq 0$

Quotient bit = 1

Else

Add divisor

Quotient bit = 0

Repeat until all bits are processed.

Final Answer

Quotient = 0100 = 4

Remainder = 0001 = 1

### **Detect Overflow**

**Overflow occurs when:**

- Divisor = 0 (Division by zero).

- Dividend exceeds register capacity.
- Partial remainder exceeds available bits.

### **Result**

Correct shifting, remainder update, and quotient generation ensure accurate division results.

## **5. IEEE 754 DOUBLE-PRECISION FLOATING-POINT ARITHMETIC Problem**

A graphics processing application experiences performance degradation due to

frequent IEEE 754 double-precision floating-point computations.

### **Debugging Steps**

1. Check whether double precision is really required.
2. Identify repeated floating-point operations.
3. Check unnecessary type conversions.
4. Analyze normalization and rounding operations.
5. Measure floating-point execution time.
6. Check compiler optimization settings.

### **Solving Steps**

#### **Optimization:**

- Replace double (64-bit) with float (32-bit) where sufficient.
- Use Fused Multiply-Add (FMA) instructions.
- Replace repeated division with multiplication by reciprocals.
- Enable SIMD/vector instructions.
- Cache repeated computations.
- Reduce unnecessary conversions.
- Enable compiler optimizations.

### **Detect Overflow**

#### **IEEE 754 overflow occurs when:**

- The computed value exceeds the maximum representable value.

Example:

Result  $> 1.7976931348623157 \times 10^{308}$

Then:

Result =  $+\infty$  or  $-\infty$

Overflow Flag = Set

Also check for:

- Underflow (very small values become 0)
- NaN (invalid operations like 0/0)

### **Result**

Using appropriate precision, optimized arithmetic operations, and

efficient hardware features improves execution speed while maintaining the required numerical accuracy.
